

What causes ice cream headache?

Q. What exactly happens when I eat something cold and get an ice cream headache? Is it harmful in any way?

A. Ice cream headache, also known as "brain freeze" or cold-stimulus headache, is a headache some people get when they consume a cold food or beverage quickly. The pain is usually in the forehead or both temples, and it usually lasts less than five minutes.

The cause is debated, but most experts believe it starts when a cold substance touches the roof of the mouth or the back of the throat and causes small blood vessels in those areas to constrict and then rapidly dilate. Pain receptors near the blood vessels sense the discomfort and send the message along tiny nerve fibers to a larger nerve (the trigeminal nerve), which forwards it to the brain. The trigeminal nerve also carries pain signals from the face. The brain reads the cold-stimulus sensations as coming from the head rather than the mouth — a phenomenon called referred pain.

Cold-stimulus pain is common, occurring in 30% to 40% of people who don't usually have headaches. The symptoms are harmless and not a sign of any underlying disease, although many experts believe they're more common in people who get migraines. Because ice cream headaches are so short-lived, they're hard to study, and there's no consensus on how to stop them. Most people have their own methods: the most common is to curl the tongue and press the underside against the roof of the mouth. The best way to prevent the headache is to eat very cold foods slowly.

For more on preventing and treating headaches, buy [Headaches](#), a Special Health Report from Harvard Medical School.

Mosquitoes

Once mosquitoes were identified as the carrier of malaria, strides were taken to prevent the spread of the disease.

One of the most effective tools for preventing its spread are nets treated with insecticide that are placed around beds. Between 2008 and 2010, 294 million nets were distributed in the sub-Saharan region of Africa, a high-risk area, [according to the Centers for Disease Control and Prevention](#).

Immunizations and indoor spraying [have also proved effective](#).

Do mosquitoes prefer some people over others? Science suggests they do, as the insects are drawn to higher metabolism rates, higher body temperatures and more sweat, among other factors.

The best bet to fend them off may be spray, as those citronella candles don't really work. [Here are some more tips](#).

Otosclerosis

Otosclerosis is a condition of progressive hearing loss in young adults due to an abnormal bone growth in their middle ear. Early symptoms include trouble hearing whispers, low pitched sounds or ringing in ears. While sound therapies can help retrain the brain to tune out the unwanted sounds; surgery, hearing aids, and cochlear implants can help correct this condition.

The middle ear, which lies just behind the ear drum, has small bones that vibrate and amplify sound waves. An abnormal bone formation here stops these small bones from vibrating. This means that sound waves cannot reach the inner ear, which in turn affects your ability to hear. This condition could affect both your ears or may be restricted to one ear. Otosclerosis generally develops in early to mid adulthood and is the most prevalent cause of hearing loss associated with the middle ear in young adults.

CureJoy

10 Ways You May Be Harming Your Liver

Did you know sugar may be as bad as alcohol? And that certain herbal supplements can be a problem? See what else can damage this vital organ.

Herbal Supplements

Even if the label says "natural," it may not be OK for you. For instance, some people take an herb called kava kava for menopause symptoms or to help them relax. But studies show that it can keep the liver from working right. That can lead to hepatitis and liver failure. Some countries have banned or restricted the herb, but it's still available in the U.S. You should always talk to your doctor before you take any herbs to make sure they're safe.

Too Much Vitamin A From Supplements

Your body needs vitamin A, and it's fine to get it from plants such as fresh fruits and vegetables, especially those that are red, orange, and yellow. But if you take supplements that have high doses of vitamin A, that can be a problem for your liver. Check with your doctor before you take any extra vitamin A because you probably don't need it.

Acetaminophen: You've got a sore back, or a headache, or a cold, and you reach for a pain reliever. Be sure to take the right amount! If you accidentally take too much of anything that has acetaminophen -- for instance, a pill for your headache and something else for your cold, and both have acetaminophen in it -- it can harm your liver. Check the dose and how much is OK to take in one day. Stick to those limits, and you should be fine.

Sugar

Too much sugar isn't just bad for your teeth. It can harm your liver, too. The organ uses one type of sugar, called fructose, to make fat. Too much refined sugar and high-fructose corn syrup causes a fatty buildup that can lead to liver disease. Some studies show that sugar can be as damaging to the liver as alcohol, even if you're not overweight. It's one more reason to limit foods with added sugars, such as soda, pastries, and candy.

WebMD

Extra Pounds

The extra fat can build up in your liver cells and lead to non-alcoholic fatty liver disease (NAFLD). As a result, your liver may swell. Over time, it can harden and scar liver tissue (doctors call this cirrhosis). You are more likely to get NAFLD if you are overweight or obese, middle-aged, or have diabetes. You may be able to turn things around. Diet and exercise can stop the disease.

Soft Drinks

Research shows that people who drink a lot of soft drinks are more likely to have non-alcoholic fatty liver disease (NAFLD). Studies don't prove that the drinks were the cause. But if you down a lot of sodas and have been meaning to cut back, this could be a good reason to switch what you sip. WebMD

What Not to Eat When You Have AFib
Beware deli turkey, instant oatmeal, and these other foods when you have atrial fibrillation.

Trans Fats

Trans fats are a man-made fat in some packaged foods and baked goods. (You'll see them listed as "partially hydrogenated" ingredients). A diet high in trans fats makes you more likely to gain weight. That's not good for your liver. Check the ingredients list. Even if it says "0" grams of trans fat, it may still have a small amount, and that adds up.

Mistakes Happen

A doctor or nurse gets nicked by a needle they've used on a patient. Or people injecting illegal drugs share a needle. The needle isn't the problem. It's what's on it. Hepatitis C can spread through blood. Even if it only happened once, or you're at high risk for other reasons (like if you have HIV or your mom had hepatitis C while pregnant with you), you should get tested. So should everyone born from 1945 through 1965.

Less Alcohol Than You May Think

You probably already know that drinking too much is bad for your liver. But you might not realize that "too much" can happen without you being an alcoholic or addicted to alcohol. It's easy to drink more than you think. Many glasses can hold a lot more than one standard serving, which is 5 ounces of wine (that's a little more than half a cup), 12 ounces of regular beer, or 1.5 ounces of liquor. If you drink, be sure to keep it moderate -- that's one drink a day for women and up to 2 per day for men.

What Not to Eat When You Have AFib

Deli Turkey

One serving of slices could have more than 1,000 milligrams of sodium. That's about half of what's OK for an entire day. Eating too much salt raises your blood pressure, and high blood pressure can raise your chance of AFib. It may also make symptoms harder to manage, so your odds of having a stroke go up. Other super-salty foods include pizza, canned soups, breads, and rolls. Check food labels to find lower-sodium options.

What Not to Eat When You Have AFib

Aged Cheese

Think cheddar, parmesan, and gorgonzola -- strong cheeses that have tyramine, an amino acid that helps raise blood pressure. Some scientists think eating foods with it may bring on symptoms for some people with heart disease. Tyramine is also in pepperoni and salami, sauerkraut and kimchee, and soybeans and snow peas.

HEART ATTACK-What Is It?

When blood can't get to your heart, your heart muscle doesn't get the oxygen it needs. Without oxygen, its cells can be damaged or die.

The key to recovery is to get your blood flow restored quickly. Get medical help right away if you think you're

What to Do

If you or someone you're with has symptoms that might be a heart attack, call 911 right away. If it is, you're more likely to survive if you get treated within 90 minutes. While you're on the phone, the person should chew and swallow an aspirin (unless they're allergic) to lower the risk of a blood clot. Are they unconscious? Hands-only CPR can double their chances of survival.

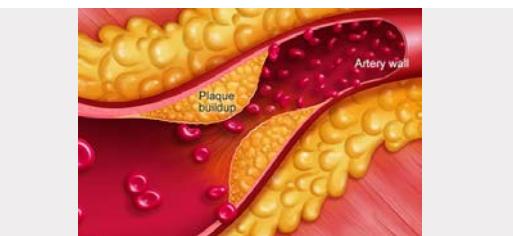

Top 7 Satiating Low-Calorie Foods

To avoid those hunger pangs and stay full all day, make sure you eat foods that are rich in fiber and protein. Fiber is slowly digested, while protein increases the "satiety hormone" leptin. Start with grains like oats or quinoa. For healthy protein sources, eat eggs, green leafy vegetables and salmon. Grapes, apples, beans etc. are delicious in salads as well. What more? You can even use some to whip up yummy protein shakes!

It's no secret that eating prevents hunger. However, some foods do a better job than others. The best choices increase satiety without adding extra calories. They have major perks too! As the day goes on, you shall be less prone to hunger pangs and headaches...

[READ MORE](#)

Causes

Over time, cholesterol and a fatty material called plaque can build up on the walls inside blood vessels that take blood to your heart, called arteries. This makes it harder for blood to flow freely. Most heart attacks happen when a piece of this plaque breaks off. A blood clot forms around the broken-off plaque, and it blocks the artery.

Symptoms

You may feel pain, pressure, or discomfort in your chest. You could be short of breath, sweat, faint, or feel sick to your stomach. Your neck, jaw, or shoulders might hurt. Men and women can have different symptoms. Men are more likely to break out in a cold sweat and to feel pain move down their left arm.

Symptoms in Women

Women are more likely than men to have back or neck pain, heartburn, and shortness of breath. They tend to have stomach trouble, including an upset stomach, feeling queasy, and throwing up. They may also feel very tired, light-headed, or dizzy. A couple of weeks before a heart attack, a woman might have flu-like symptoms and sleep problems.

Why do some activities produce more dopamine in the brain than others?

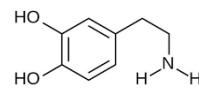

Kieran Doran Medical Student at the University of Edinburgh
MBChB Medicine, University of Edinburgh Medical School Expected 2019

Dopamine is an extremely misunderstood brain chemical.

Dopamine does not cause pleasure in the brain. I have read many articles which state dopamine gets released in the brain and causes pleasure. But the causation is the wrong way round. Dopamine release doesn't cause pleasure - pleasure causes dopamine release.

Scientists did used to think dopamine causes pleasure, but that is now not the most accepted rule in neuroscience.

So, when someone eats a sugary food, the taste causes pleasure in the brain, and dopamine is released which signals the brain that it wants more. When someone injects heroin, the heroin causes direct pleasure in the brain and a huge spike of dopamine is released. But that is because the pleasure is so extreme that dopamine tells the brain it wants more. So the more dopamine released, the more pleasurable the activity (as a general rule).

Dopamine

What dishes can be made with at most 3 ingredients?

Quynh Ng

Last weekend, I was only home for 24hrs before flying out for work again. With only one day in town, my husband and I decided to clean out our fridge instead of buying more items. We had some leftover napa cabbage and mushrooms from making dumplings the other week and some green onions. We sautéed those items and the finished item was the following dish:

It was actually very good over white rice.

The Best Strengthening Exercises for OA Symptoms

While most osteoarthritis treatment plans focus on medication for pain and swelling, don't underestimate what exercise and physical activity can do for you. Try adding these exercises to your weekly routine. [Read on →](#)

5 Great Ways To Get Rid Of Blackheads Using Egg White

Blackheads are a mild form of acne and commonly appear on the face. They form when your hair follicles get clogged by dead skin cells and natural oil called sebum. Blackheads are called so because the skin over the bumps formed due to clogged follicles opens up and gets exposed to the air, making them look black...
